Industrial Quarterly Visual Monitoring

Quarterly visual monitoring (QVM) is required in the Multi-Sector Generic Permit (MSGP) permit for all [Industrial facilities](#). A **QVM** helps assess the degree of your best management practices (BMPs) effectiveness at reducing the potential for contamination of stormwater runoff as it leaves your facility.

Quarterly visual monitoring may also indicate a source of pollution that you had not considered during the development of BMPs, such as recurring spills or an infrequent industrial activity.

KCI can help you with all your compliance needs. We have the proper training to conduct routine inspections required under the MSGP and can help with permit renewal. We are also able to collect water samples and complete adequate documentation regarding discharge information. Call KCI today for more information, and we will gladly work to keep you in compliance!

All sectors of the MSGP, except Sector S, require "Quarterly Visual Monitoring" of stormwater discharges. The visual examination is considered a monitoring requirement; however, it does not require the sample to be analyzed by a laboratory. The results of the QVM are required to be kept by the facility with its Stormwater Pollution Prevention Plan (SWPPP).
